

First it will awe you...

Envyrn™ Graphics Key

[illegible]

Tile 1

Tile 2

Tile 3

Explanation of tile sets:

The three tiles are the three different resolutions that can be displayed. The nine letters below the second and third tiles are the tile's identification. The three characters below the third tile contain important information about the tile set. The first byte contains the accessibility code (A = Accessable, B = Barrier, S = Swimable, etc.) The second byte is used to store the reciprocal: that is, the tile to be exchanged with the tile set. (An open door is the reciprocal of a closed door.) The last byte contains any special feature of the tile set (J = Jump, E = Enterable, etc.) More on this will appear in a future issue of **SoftSide**.

The above photos depict the logical order of travel to the church. You travel overland through the southwest mountains to the mountain town. Your position will be jumped to an area in the middle-eastern edge of the map where the town is blown up to detailed buildings. If you approach the church and ask to enter, you will appear at the door on the inside. The steps through the north door will send you to the second floor. This is accomplished with the jump coordinates shown at the bottom of the data dump.

To the right is a dump of the map array's raw data. If you carefully compare the letters used and their position within the array with either the graphic legend in the centerfold or the more compact version below, you can reconstitute the entire centerfold. This is the actual information that is being stored and changed.

To the left is the balance of the map array which stores all the graphic tiles and characteristics. These tiles have been broken up for clearer viewing elsewhere. However, these lines of information depict the tiles as they exist in raw form. Keep in mind that the top three lines store the highest resolution tile, the fourth and fifth lines' first six characters store the middle resolution tile and in the fourth line, characters seven thru nine are used for the low resolution tile. The balance is the description and characteristics block.
